

ACOUSTICS

TROX acoustics has 2 reverberation chambers. They meet the recommendations for [reverberation chambers](#) in accordance with ISO 3741 (Determination of sound power levels of noise sources using sound pressure - Precision methods for reverberation rooms). In the acoustics laboratory, sound measurements are taken. These measurements are indicative or supportive in the development of new products.

Furthermore, measurements are taken for the regular quality control of existing products and product modification as well as for project-related special products according to customer requirements. Measurements on sound attenuators are a special form of acoustic measurement. A special [sound attenuator test](#) run has been set up for these measurements. These meet the requirements of ISO 7235.
